

Toxic Gas Monitoring Solutions

Help protect the staff that helps protect patients

In today's busy world, Medical Device Reprocessing (MDR) Professionals work hard to provide sterile products to the operating room. Millions of instruments are processed each year via low temperature sterilization, a process that uses high concentrations of sterilant gases to kill microorganisms that could cause infection. Accidental exposure to these toxic sterilants can pose long term health risks to the hospitals' MDR professionals.

- Impending alerts allow hospitals to proactively correct problems
- Easy to understand, LED display with multiple alarm levels
- Scalable and customized to each installation
- Monitoring for safe use of low temperature sterilization
